Java Programming

Description

The Java Programming course provides an introduction to the fundamentals of the Java language. Topics covered include language fundamentals, OO concepts, classes and interfaces, exception handling, application/applet development, GUI development, file I/O, collections, threads, networking, JDBC.

Objectives

Delegates who complete the Java Programming course will be able to:

- Understand object-oriented concepts as they pertain to Java.
- Read, develop and debug Java code using Java language constructs.
- Develop console-based Java applications.
- Develop event-driven GUI-based Java applications and applets using AWT and Swing.
- Implement error-handling techniques using exception handling.
- Implement I/O for reading and writing data and text files.

Intended Audience

The Java course is for experienced programmers who want to develop applications in Java.

Prerequisites

Experience in programming - preferably with C or C++. Knowledge of object oriented programming would be beneficial.

Course Contents

The lecturer reserves the right to modify the contents of the course to suit the needs of the delegates.

Overview • Java language history. • Portability and the Java Virtual Machine. • The Java Development Environment and tools.

OO Concepts • Object-oriented vs structured programming. • Data encapsulation. • Classes, attributes and behaviours. • Inheritance and code reuse. • Abstract classes and interfaces.

Applets and Applications • Applets versus applications. • Creating Java applications and applets. • Web browser incompatibilities.

Fundamentals • Keywords, identifiers and literals. • Primitive and object reference data types. • Variable declarations, initialization and scope. • Expressions, operators and operator precedence. • Selection and iteration statements. • Exception handling. • Modifiers.

Classes, Interfaces and Packages • Creating and using classes. • Encapsulation - fields and methods. • Constructors and initializers. • Polymorphism - overloading and overriding. • Inheritance - subclasses and superclasses. • Abstract classes and interfaces. • Canonical classes and JavaBeans. • Inner classes. • Packages.

Strings and Arrays • String methods and concatenation. • Strings versus StringBuffer. • Creating, initializing and using arrays. • Collections API overview.

GUI Development • Abstract Windowing Toolkit and Swing. • Primitive graphics and images. • GUI components, containers and layout managers. • Event-driven programming.

File Input/Output • Standard System streams. • Files, Streams, Readers and Writers. • Serializable interface and the transient modifier.

Threads and Multi-tasking • Multi-tasking overview. • Using and creating threads. • The Runnable interface. • Thread attributes, priorities and synchronization.
